TITLE: Absorption of high frequency energy by plasma in the ion cyclotron resonance in strong high frequency fields

SOURCE: AN UkrSSR. Vysokochastotnyye svoystva plazmy (High frequency properties of plasma). Kiev, Naukovo dumka, 1965, 15-26

TOPIC TAGS: plasma heating, plasma oscillation, plasma velocity, plasma density, cyclotron resonance, ion beam, electron collision

ABSTRACT: The present work continues the study of the absorption of high frequency waves by a plasma in the ion cyclotron resonance. The conditions for heating of plasma by this method and the physical processes which occur in various regimes are briefly reviewed. The nature of energy absorption is studied in the experiment with a high frequency wave applied to the plasma with a density of  $10^{13}$  electrons/cm<sup>3</sup> and an axial current flow of 30 A/cm<sup>2</sup>. It is shown that the absorption of the wave depends on the interaction between ions and electrons of the plasma. This result is described by equations derived for the case of absorption by collisions. In the experiments where the electric field of the wave exceeded the critical value (which determines the maxi-

Card 1/2

ACC NR: AT6020563

man absorption for two-body collisions), the effective collision frequency increased strongly. This increase is attributed to the deceleration of the directed ion beam in the cyclotron wave by high frequency plasma oscillations induced by ion beams with velocities exceeding the thermal velocity of the plasma. The experimentally determined effective collision frequency is within an order of magnitude of that arising from the above mechanism. Orig. art. has: 11 formulas, 3 figures.

 TITLE: <sup>21,44,55</sup>Resonance heating of plasma by means of a strong high-frequency field  
 SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu. Prilozheniye, v. 2, no. 9, 1965, 418-422  
 TOPIC TAGS: <sup>21,44,55</sup>plasma heating, dense plasma, magnetic energy absorption, acoustic wave, h-f field, electric field, magnetic field  
 ABSTRACT: An investigation was made of the heating of a dense plasma by powerful short high-frequency pulses when in plasma a fast magnetoacoustic wave ( $\Omega_e \gg \omega_e$ ,  $\omega_i < \omega < \omega_e$ , where  $\Omega_e$  is the plasma electron frequency,  $\omega_i$ ,  $\omega_e$  are cyclotron frequencies of ions and electrons, respectively, and  $\omega$  is the operating frequency) is generated by means of resonance. The investigations were carried out on a disintegrating plasma present in a quasi-constant longitudinal magnetic field with an intensity reaching 6000 Oe. The plasma was generated by a pulse discharge with oscillating electrons in hydrogen and helium at a pressure of  $10^{-3}$  mm Hg. The coefficient of energy transfer (the ratio of the energy absorbed by the plasma to the total energy stored in the circuit) of an h-f field from the circuit to the plasma was measured. The dependence of the coefficient on the intensity of a  
 Card 1/2

L 9283-66

ACC NR: AP6000738

quasi-magnetic field for different values of the initial electron density shows that the absorption of energy of an h-f field by the plasma has a resonance character, its maximum corresponding to a frequency  $\omega$ , which is in the range  $\omega_1 < \omega < \sqrt{\omega_1 \omega_e} \ll \omega_e$ . A similar dependence was obtained for a helium plasma. The dependence of the transfer coefficient, the electron temperature, and the increase of electron density on the intensity of the magnetic field shows that the electron temperature  $T_e$  rises when the energy absorbed by the plasma increases, reaching approximately 60 ev. At the same time, the density of electrons also increases and the degree of ionization approaches 100%. The temperature of ions  $T_i$  is approximately 30 ev. The heating of the plasma takes a short time: at maximum absorption the amplitudes of h-f oscillations in the circuit decrease by 2.7 times per  $\sim 0.5 \mu\text{sec}$ , i. e., during 2—3 oscillation periods; without plasma this decrease takes approximately 11 periods. The calculated damping decrement  $\gamma_{\text{exp}} \approx 6.5 \times 10^{-2} \omega$  (from the rate of the decrease in the amplitude oscillation in the circuit) exceeds the damping decrement of the magnetoacoustic waves, which is subjected to Coulomb losses, by more than two orders. The temperature, calculated from the energy balance under the assumption that the entire energy absorbed by the plasma is spent on its heating, is equal to  $\sim 90$  ev, which is in agreement with experimental data. Orig. art. has: 2 figures. [JA]

Abs Jour: Ref Zhur-Biol., No 9, 1958, 4043b.

Abstract: samples the following fractions were determined:  
1) of total N., 2) N of casein, 3) N of the  
soluble proteins (albumin and globulin), 4) non  
protein N. It was established that in cows  
which were given ample feeds during the dry  
period, the amount of soluble proteins in the  
colostrum was 2% - 9% higher. The increased  
level of mineral feeding (in heifers) also had  
a positive influence on this index. The differ-  
ent composition of rations was without effect.  
The different methods of the determination of  
globulin were also appraised.

4923. GRIGORYEVA L. V. and BLINOFF N. I. \* Use of the antibiotic aspergine in surgery (Russian text) VESTN.KHIR. 1953, 73/4 (42-48) Tables 1

Aspergine, a new antibiotic, acts on all Gram-positive microbes in general and especially on the germs of the intestinal flora and on the enterococcus. In trials carried out from March 1951 onwards at the Leningrad Surgical Clinic aspergine was shown to possess an effective antibiotic power both for prophylaxis and for treatment. One of its advantages in comparison with the other antibiotics is the possibility of injecting it i.v. Moreover, as far as activity is concerned, it can fully replace penicillin. The i.v. injection of 10-20 ml. of a 10% solution of aspergine does not cause any untoward reaction. Aspergine dissolved in an isotonic procaine solution may be introduced into the peritoneal cavity. The i.p. or s.c. injection of aspergine in cases of suppurative or phlegmonous appendicitis enables one to close the wound completely without drainage. Moreover the i.v. injection of aspergine is extremely useful for the lowering of fever and for the improvement of the patient's general condition during the post-operative period. Finally it was shown that i.v. aspergine has an excellent effect on the evolution of acute thrombophlebitis. Parenti - Ferrara (IX,2,6)

TITLE: Survivability of bacteria and viruses in vegetables irrigated with infected water

SOURCE: Gigiyena i sanitariya, no. 12, 1965, 28-31

TOPIC TAGS: bacteria, virus, human ailment, bacteriology, virology, agriculture crop

ABSTRACT: The use of liquid wastes to irrigate the soil harbors the danger of infecting the vegetable crops, particularly when the sprinkling method is employed. In this connection, the time span of survival of pathogenic bacteria and viruses in vegetable crops is of major significance. The published literature on this subject is contradictory. To bring some clarity into this matter, the authors investigated the survivability of pathogenic bacteria of the intestinal group (Salm. typhimurium, Shig. sonnei, Shig. Flexneri), Coxsackie viruses of group A (A5, A7 and A14), and E. coli in the foliage and fruits of plants irrigated with infected water (tomatoes, lettuce, and sweet pepper, i.e., vegetables which are most often eaten raw).

Card 1/2

UDC: 613.26:628.37/ 576.8.095.1

ACC NR: AF6018414

This was followed by 21 series of experiments which revealed that the survivability of the pathogenic microorganisms differs depending on the biological properties of a particular crop. Intestinal bacteria survive longer in the foliage of tomatoes grown in shadow (6-18 days) than in the foliage of tomatoes grown in the sun (3-4 days). They survive longer in the foliage of sweet pepper than in the foliage of lettuce, and they survive longer in the fruits than in the foliage. The same pattern can be observed for viruses; their survivability also depends on the type of crop, conditions and period of vegetation, and object of irrigation (foliage or fruit), though in general they survive somewhat longer than bacteria. Of the pathogenic bacteria of the intestinal group, *B. breslau* survived the longest (18 days), and *Shigella sonnei* the shortest (2-11 days). Of the three crops investigated, lettuce foliage -- possibly because of its smoothness -- provided the least favorable conditions for survival of bacteria and viruses, and tomato foliage -- the most favorable. TITLE: Amperometric determination of quadrivalent and trivalent vanadium with pyrocatechol

SOURCE: Leningrad, Universitet. Metody kolichestvennogo opredeleniya elementov (Methods for the quantitative determination of elements). Leningrad, Izd-vo Leningr. univ., 1964, 72-76

TOPIC TAGS: vanadium determination, pyrocatechol, amperometric titration, redox potential, polarographic oxidation

ABSTRACT: A method was developed for determining vanadium IV and vanadium III in aqueous solutions by titration with pyrocatechol. Pyrocatechol was shown to form dark blue and dark brown complexes with V(IV) and V(III), respectively, and the redox potential of the system was studied at various concentrations of pyrocatechol and at pH 1.5-8 in preliminary tests. The polarographic oxidation of pyrocatechol in acetate buffer solutions of pH 1.5-5.7 was measured. Titration of 0.102-0.204 mg V(IV) at pH 1.5-5.7, using a Pt microelectrode and a saturated calomel electrode as indicating and reference electrodes, respectively, gave acceptable results at all pH levels with a maximum relative error of 3.5%.  
1/2

L 36248-65

ACCESSION NR: AT5007817

Determination of V(III) under similar conditions in a CO<sub>2</sub> atmosphere was shown to be feasible only at pH 1.5 but not in less acidic solutions. Thus, the total concentration of vanadium can be determined at pH 1.5, that of vanadium IV at pH 3.1-5.7, and that of vanadium III can be calculated. Orig. art. has; 3 figures and 4 tables. D.

TITLE: The АСГК-1 (ASGK-1) automatic welding head

PERIODICAL: Byulleten' tekhniko-ekonomicheskoy informatsii, no. 3, 1961, 23 - 24

TEXT: The NIItraktorosel'khoz mash Institute has developed the stand-type ASGK-1 automatic welding head for the shielded-arc and submerged-arc welding of circular seams of parts of various diameters. It can also be utilized for the welding of longitudinal seams of parts traveling during the welding process relative to the stationary head. The welding head (see illustration) is mounted on a self-propelled carriage and consists of stand with platform 1, wire feed mechanism 2, extensible bracket 3 with clamping device for torch 4, conductor 5, and portable control panel 6. the overhang between the torch axis and stand axis can be set in the range of 250 - 400 mm. The bracket is fixed with the aid of handwheel 7. The automatic welding head design makes it possible to carry out angular welding "forward" and "backwards". The angles are fixed with the aid of handwheels 7 and 8, the vertical travel of the torch within a range of 100 mm is effected by handwheel 9. The torch position can be corrected in trans- ✓

verse direction in a range of 60 mm by handwheel 10, while the bracket can be turned through 360° and fixed by handwheel 11. The following technical data are given: welding current - 150 - 600 amp; arc voltage - 25 - 40 v; wire feed speed - 50 - 650 m/h; welding wire diameter - 0.8 - 3 mm; overall head dimensions (length x width x height) - 700 x 250 x 1,000 mm; weight - 50 kg. The ASGK-1 welding head has been introduced at the Lyuberetskiy zavod sel'khoz-mashinostroyeniya im. Ukhtomskogo (Lyubertsy Plant of Agricultural Machines imeni Ukhtomskiy) for the production of the СШР-0.5 (SShR-0.5) hay stacker. There is 1 figure. TITLE: Proteolytic changes of white and red muscles during refrigeration of chicken meat 22

SOURCE: Kholodil'naya tekhnika, no. 2, 1966, 28-31

TOPIC TAGS: food, refrigeration, low temperature effect, *COMMERCIAL ANIMAL*,  
*FOOD CHEMISTRY*

ABSTRACT: This article gives comparative investigations of the changes of proteolytic activity and the accumulation of free amino acids in white and red muscles during refrigeration of chicken meat. The proteolytic activity was determined by the change of the optical density of filtrates after precipitation with trichloroacetic acid which were obtained as a result of 4-8 hr incubation at 37C of denatured horse blood hemoglobin with muscle tissue extracts before and after thermostating. The change of optical density of the filtrate was referred to 1 mg of protein extract. The optical density was determined on a spectrophotometer at 279  $\mu$ . The content of amino acids was established by one-dimensional partition

chromatography with subsequent photolorimetric analysis of their copper derivatives. The investigation revealed that the initial proteolytic activity of extracts of red muscles is, by a factor of 14, higher than extracts from white muscles. During autolysis it drops for the red muscles, however it remains higher than that for the white muscles. During autolysis of the white muscles the proteolytic activity of the extracts increases and by the end of eight days reaches the original activity of the red muscles. Freezing and thawing increase the proteolytic activity of muscles. After storing red muscles in a frozen form for two, and of white muscles for four months, there was a further increase of proteolytic activity of the muscle extract after their thawing. With a longer storage time the proteolytic activity remains just as high, only dropping somewhat with an increase of storage time. The nonautolyzed red muscles, in comparison with the white, contain appreciably more free amino acids, especially glutamic acid and glutamine. Under identical conditions of autolysis free amino acids are accumulated more intensely in unfrozen red muscles than in white muscles. After freezing the muscles and storing them in a frozen form there is an appreciably greater accumulation of free amino acids in comparison with unfrozen muscles, this being more pronounced for the red muscles. TITLE: Underwater electronic robot

SOURCE: Ekonomicheskaya gazeta, no. 7, Feb. 67, p. 16, cols. 1-5

TOPIC TAGS: marine <sup>equipment</sup> ~~equipment~~, geologic instrument

**ABSTRACT:** An underwater geological robot is being developed at the Laboratory of Marine Electronics of the Institute of Oceanology, Academy of Sciences USSR, under the direction of N. Vershinskiy and V. Yastrebov. The robot will be capable of carrying out various geological operations 4—6 km below the ocean's surface. The robot will consist essentially of two spheres (each 50 cm in diameter) mounted on a special frame. One sphere will contain a TV system with a frequency band of 70 kHz instead of the usual 7 MHz. Frame frequency will be only one frame per second. Such a system will make it possible to replace the multistrand TV cable with a steel truss having three current-conducting strands. The second sphere will house a camera for making "stills." The robot will also have manipulators or "hands" capable of ten types of motion. [NC]

COMMENTARY: This is a collection of 12 articles. In the first four articles V.A. Pavlovich deals with the formation of clouds and planets, describes their evolution and their filaments in the regions of galactic nuclei, and reports on the results of his investigations of the formation of clouds and planets in the immediate vicinity of the centers of galaxies. In the next two articles the author deals with light in the field of a rotating black hole and the physical mechanism of the emission of light. The remaining articles, written by different authors, deal mainly with problems of cosmology such as the scattering of light in the atmosphere, in the nearest interstellar regions of the Galaxy, etc.

optimum utilization of our lands and the nation to the south, clearing, drainage, and reforestation of the mountainous regions, reflecting equality of opportunity to the Atlantic and Pacific regions of the spectrum, and the transportation of goods and materials to the satisfaction of their immediate markets. ABSTRACT: The author determines the colour indices and photographic magnitudes of 511 stars in the region of the cluster NGC 6940. The photographs have been made in 1953 near Alma - Ata in the Institute for Astrophysics of the AS Kazakh SSR. An H-R diagram was constructed using results of R.A. Rach and S. Vasilevskis [Ref 3]. The luminosity function for the cluster was derived. The interstellar absorption has been estimated according to a method due to P.P. Parenago [Ref 5]. There are 3 figures and 5 references, 1 of which is Soviet, 2 are American, and 2 English.

TITLE: Hot stars in the cluster NGC 6823 and its immediate surroundings

SOURCE: Moscow. Univ. Gos. astron. inst. Soobshch., no. 118, 1962, 65-69

TOPIC TAGS: astronomy, star, star cluster, O-B star, hot star, Milky Way

ABSTRACT: The Kry\*mskaya astrofizicheskaya observatoriya AN SSSR (Crimean Astrophysical Observatory) has been making a study of the Milky Way; a spectral classification is being made and stellar magnitudes and color indices for stars up to  $12^m.5$  in various parts of the Milky Way are being determined. In a region with the center  $\alpha = 19^h32^m$ ,  $\delta = +22^\circ$  (coordinates of 1950.0) 63 hot stars of classes O-B have been discovered in an area of 36 square degrees. These stars are distributed very unevenly, almost half being concentrated in an area of 3 square degrees with the center  $\alpha = 19^h41^m$ ,  $\delta = +23^\circ$ . The open cluster NGC 6823 is located near this center, possibly being the nucleus of an O association. The position of these 30 stars is shown on the map (Fig. 1 of the Enclosure) and all data are shown in Table 1. The cluster includes 12 stars of classes O-B; 5 stars surround the star BD  $+23^\circ37'60$ . Table 2 lists the spectral classes for the stars of the cluster NGC

Card 1/3

ACCESSION NR: AT4038541

6823, determined by the author and derived from other sources. The spectral classes were determined from 4 plates. True distance to the cluster was found to be 1800 parsecs. Data on color excess also are given. "In doing this work the author received valuable advice from E. S. Brodskaya and I. I. Pronik, colleagues at the Crimean Astrophysical Observatory, to whom she expresses her gratitude." Orig. art. has: 1 figure and 2 tables.

TITLE:

Substitution Reactions in Dipyrldine Complex Compounds of Bivalent Nickel and Cobalt (O reaktsiyakh zameshcheniya v dipiridinovykh kompleksnykh soyedineniyakh dvukhvalentnykh nikelya i kobal'ta)

PERIODICAL:

Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 2, pp 330-336 (USSR)

ABSTRACT: The substitution reactions in dipyrldine complex compounds of bivalent nickel and cobalt were investigated in order to find out the influence of the individual addenda on the complex.  $\text{NiPy}_2\text{Cl}_2$  and  $\text{CoPy}_2\text{Cl}_2$  were used as initial compounds. The latter compound exists in two modifications:  $\alpha$ -violet and  $\beta$ -blue. It was found that in alcoholic solutions of  $\text{NiPy}_2\text{Cl}_2$  and  $\text{CoPy}_2\text{Cl}_2$  the chlorine ion may be exchanged by bromine, nitrito, thiocyanogen, and oxalate groups. The following compounds were produced:  $\text{NiPy}_2(\text{NO}_2)_2 \cdot 2\text{H}_2\text{O}$  in the form of prisms, refractive index  $N_1 = 1.682$  and  $N_2 = 1.530$ . The

Substitution Reactions in Dipyridine Complex Compounds ofivalent  
Nickel and Cobalt

compound is soluble in water and acetone, and insoluble in chloroform. The solubility in methyl alcohol is 9.52% at 25°C;  $\text{NiPy}_2(\text{NCS})_2$  crystallizes in the form of fine blue crystals which show a solubility of 1.6% in methyl alcohol; for the first time  $\text{NiPy}_2\text{C}_2\text{O}_4$  was separated (blue crystals).

$\text{CoPy}_2(\text{NO}_2)_2$  crystallizes in the form of yellow-pink crystals;  $\text{CoPy}_2(\text{NCS})_2$  crystallizes in the form of violet prisms. On joint crystallization in alcoholic solutions of  $\text{NiPy}_2\text{Cl}_2$  and  $\text{NiPy}_2(\text{NO}_2)_2 \cdot 2\text{H}_2\text{O}$ , and  $\text{NiPy}_2\text{Br}_2$  and  $\text{NiPy}_2(\text{NO}_2)_2 \cdot 2\text{H}_2\text{O}$ , respectively, the following isomorphous compounds were produced:  $\text{NiPy}_2\text{NO}_2\text{Cl} \cdot 2\text{H}_2\text{O}$  and  $\text{NiPy}_2\text{NO}_2\text{Br} \cdot 2\text{H}_2\text{O}$ , respectively.

Cobalt did not show similar compounds. The X-ray analyses of these compounds showed that new isomorphous compounds have been found. The electric conductivity in the nickel dipyridine compounds was determined and magnetic investigations were carried out; (the latter by V. I. Belova). The

Substitution Reactions in Dipyrindine Complex Compounds of Bivalent  
Nickel and Cobalt

properties of the dipyrindine nickel compounds are shown in detail in table 2. The stability in alcoholic solutions has the following order:  
 $\text{NiPy}_2(\text{CNS})_2 \gg \text{NiPy}_2(\text{NO}_2)_2 \gg \text{NiPy}_2\text{NO}_2\text{Cl} \gg \text{NiPy}_2\text{NO}_2\text{Br} \gg \text{NiPy}_2\text{Cl}_2 \gg \text{NiPy}_2\text{Br}_2$ . There are 2 tables and 12 references, 4 of which are Soviet.
